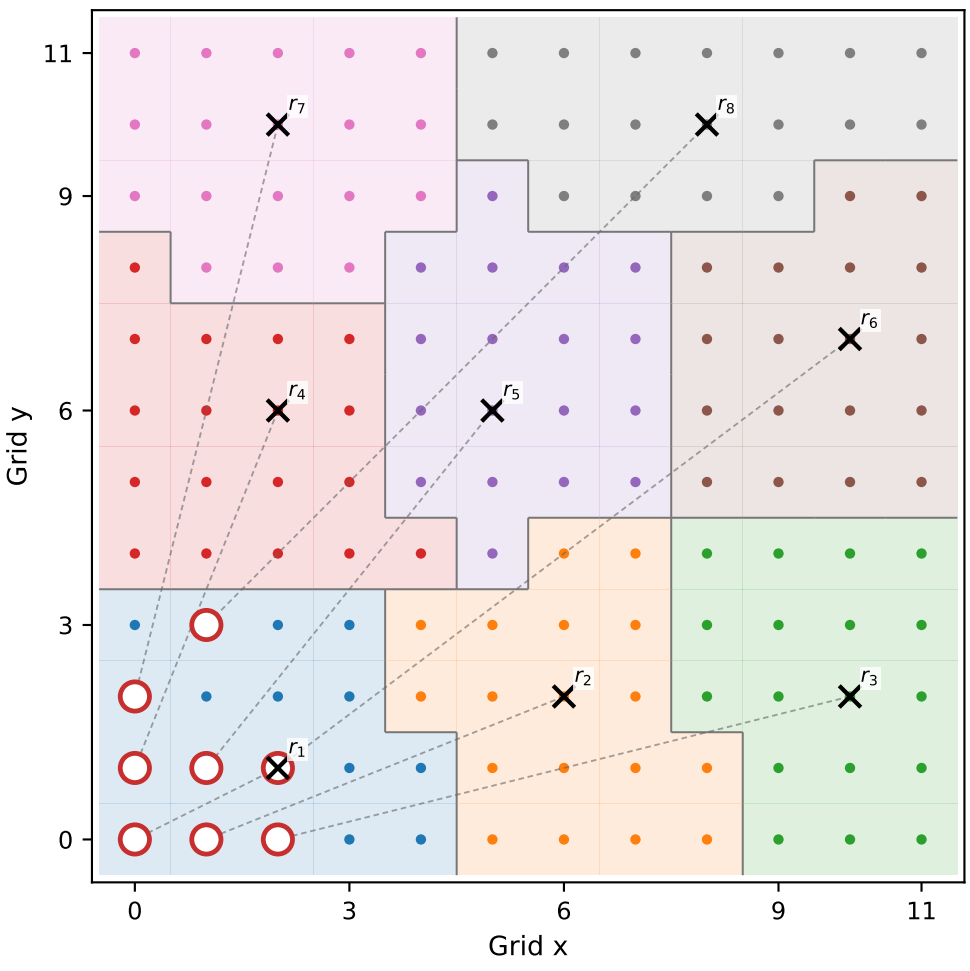
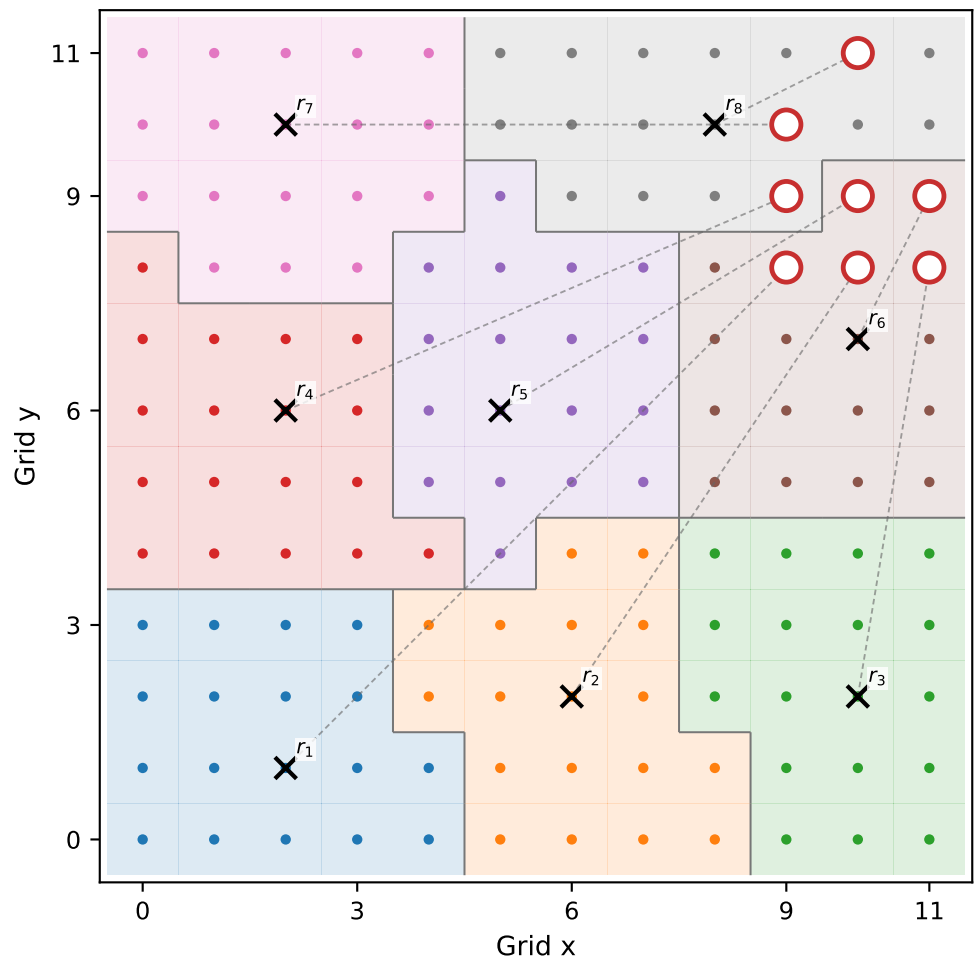
The same concentrated sample in four positions

Fixed 12 × 12 population • $N = 144$, $n = 8$, $\pi_\ell = 1/18$ • independent IPnM fits for each new position

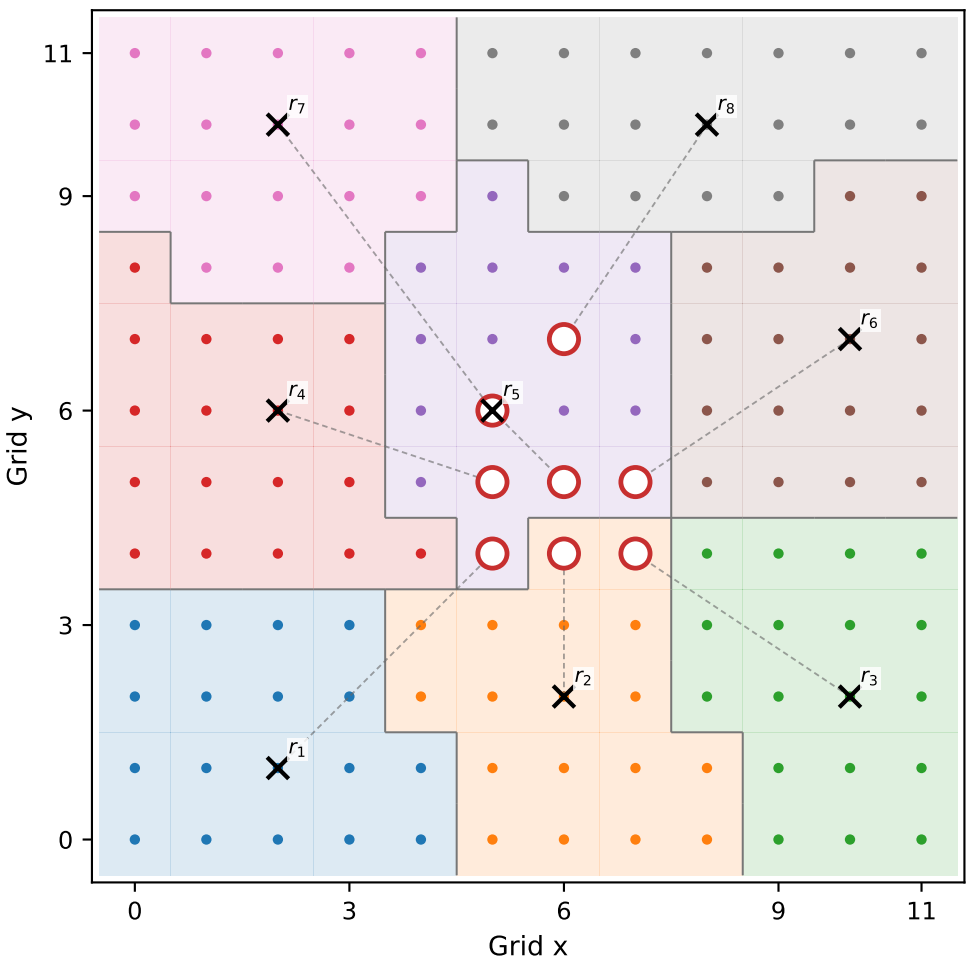
(a) Original: bottom-left | shift (0, 0)
DI = -0.9977095004
Changed memberships: 0/144; DI difference: +0.0000000000



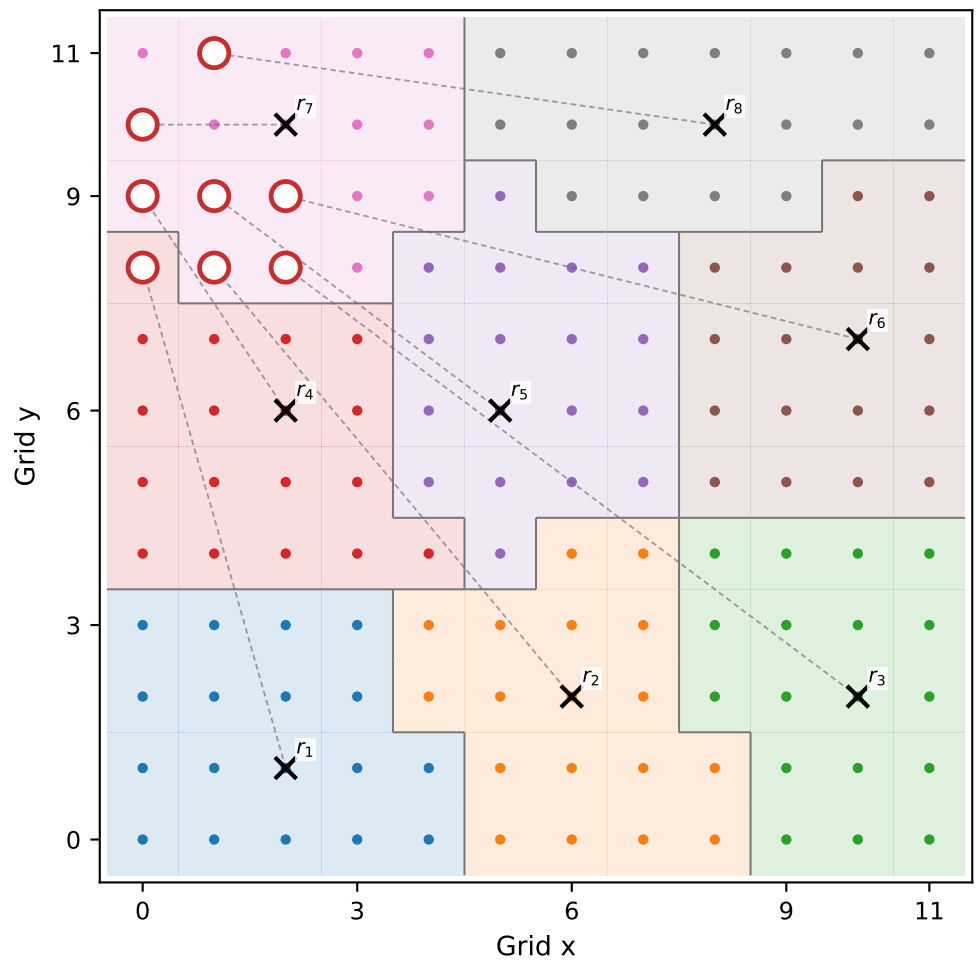
(b) Top-right corner | shift (9, 8)
DI = -0.9977095004
Changed memberships: 0/144; DI difference: +0.0000000000



(c) Middle | shift (5, 4)
DI = -0.9977095004
Changed memberships: 0/144; DI difference: +0.0000000000



(d) Top-left corner | shift (0, 8)
DI = -0.9977095004
Changed memberships: 0/144; DI difference: +0.0000000000



Population unit (cluster color) | Selected sample unit | Medoid | Squared-distance matching

Cluster colors aligned with the original partition. The population stays fixed; only the eight sample locations change.
